

## Past Success, Present Gaps: VMMC targets, 2011 and today

	EVIDENCE	TARGET	RESOURCES	IMPACT
<b>2011</b>  <b>VMMC</b> 	Three trials show 60% reduction in HIV acquisition for HIV-negative men. (2006)  	US President Obama sets PEPFAR goal of 4.7 million VMMCs by 2013. (2011)  	Combined 2012 and 2013 PEPFAR commitments quadruple 2011 funds. (2013)  	Pace of VMMC scale-up doubles each year after 2011 and target is exceeded. (2013)  
<b>TODAY</b>	Men's protection persists and improves over time. Communities with high coverage are seeing incidence drop in men and women.	Annual and long-term targets based on maximum capacity are needed—and missing.	Unclear and in danger of falling.	High VMMC coverage is essential to effectively ending AIDS.
